                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Accession: A6021

A. Title: Purification and characterization of glycogen phosphorylase (EC 2.4.1.1), muscle - mullet (Liza ramada) (fragment)

N. Alternate names: glycogen phosphorylase b
C. Species: Liza ramada
C. Date: 17-Apr-1993 #sequence_revision 17-Apr-1993 #text_change 18-Aug-2003
C. Accession: A6021
C. Accession: A6021
C. Bananate, L. B 95, 295-301, 1990
A. Title: Purification and characterization of glycogen phosphorylase B from skeletal musch Reference number: A6021; MUID: 90227907; PMID: 2109669
A. Accession: A6051
A. Molecule type: protein
A. Accession: A6051
A. Molecule type: protein
C. Superfamily: glucan phosphorylase
C. Reywords: glycosyltransferase; hexosyltransferase; phosphoprotein
F: 3/ Binding site: phosphate (Ser) (covalent) (by phosphorylase b kinase) #status experim

Hadellar procein filk - Salmonella typhimurium (fragment)

Cispecies: Salmonella typhimurium

Cispecies: Salmonella typhimurium

Cispecies: Salmonella typhimurium

Cispecies: Salmonella typhimurium

Rivogler, A.P.; Homman, M.; Irikura, V.M.; Macnab, R.W.

A. Bacteriol. 173, 3564-3572, 1991

A. Bacteriol. 173, 3564-3572, 1991

A. Firtle: Salmonella typhimurium murants defective in flagellar filament regrowth and seq A. Stetus: preliminary

A. Soloceuse type: DNA

A. Soloceuse type: DNA

A. Stetus: Carlonian Salmonella Salmonell
Title: The main features of the craniate mitochondrial DNA between the ND1 and the CO1 Reference number: Z17775; MUID:97389704; PMID:9254918
Accession: T13892
Status: preliminary; translated from GB/EMBL/DDBJ
Molecule type: DNA
Residues: 1-3 < DEL>

family

Peptides AAR81847-54 are tryptic peptide fragments from human afamin (AAR81845) novel member of the human serum protein family. The fragments were used to design primers and probes (AAT00786-98) for the cloning of the afamin gene (AAT00785) from human liver cDNA. Afamin is thought to have similar properties to human albumin, alpha-foetoprotein and vitamin b binding protein due to homology with these proteins. The gene encodes a mature protein of 66576 daltons without post-translational processing (ca. 87000 daltons with post-translational processing isolated from human plasma by a conventional chromatographic methods. The

dimensional array of features. The method can be used for screening, dimensional array of features. The method can be used for screening, diagnosis and prognosis of RA in a method can be used for screening, of an anti-RA drug or therapy administered to a subject. The method comprises: (a) analysing a sample of serum or plasma and optionally sources; (a) analysing a sample of serum or plasma and optionally symbol by two-dimensional electrophoresis, to generate a two-dimensional array of features; (b) identifying at least one chosen feature whose relative abundance correlates with the presence or absence of RA; and (c) comparing the abundance of each chosen feature in the sample with the abundance of that chosen feature in serum or plasma from one or more persons without RA, where the relative abundance of the chosen feature of features in the sample indicates the presence or absence of serum or plasma from the subject. The method can also be used in clinical studies for testing drugs for therapy of RA, for purification of RA-diagnostic protein isoforms (RPIs), and for production of antibodies to RPIs. The RA-diagnostic feature (RAPIs) proceins can be used to identify compounds that promote or inhibit their activity, which are then used as proceouls. AAV41844 to AAV42101 represent RA propocoles contains RAPS can be used in gene therapy proceouls. AAV41844 to AAV42101 represent RPI peptidies, AAV442101 represent SPIS, which are all AAV42101 represent proceed process and

Detecting VD-associated features and VpI is useful for the screening, diagnosis or prognated features and VpI is useful for the severity of VD, for identifying a subject at risk of VD or for monitoring the effect of therapy administered to a subject having VD. Nucleic acids encoding a VPI or inhibiting the function of a VPI are useful for the treatment of VD and for gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Screening, diagnosis or prognosis of vascular dementia (VD), useful for determining stage of VD and monitoring the effect of VD therapy, comprises analyzing body fluid by 2-dimensional electrophoresis for features correlated with VD.
                                                                                                                                                                                                                                                                                                                                                                                                                     Vascular Dementia; VD; VD-associated protein isoform; VPI; screening;

Vascular dementia-associated protein isoform (VPI) 181

15-FEB-2002 (first entry)

```
Screening, diagnosis or prognosis of vascular dementia (VD), useful for determining stage of VD and monitoring the effect of VD therapy, comprises analyzing body fluid by 2-dimensional electrophoresis for features correlated with VD.
                                                                                                                                           VD; VD-associated protein isoform; VPI; screening;

The invention relates to screening, diagnosis or prognosis of Vascular Dementia (VD) in a subject comprising analysing body fluid from the subject by 2-dimensional (2-D) electrophoresis to generate a 2-D array of features containing at least one chosen feature whose relative abundance correlates with the presence, absence, stage or severity of VD or predicts the onset or course of VD, especially detecting in a sample of cerebrospinal fluid (CSF) from the subject one of 223 VD-associated protein isoforms (VPIS) (ABBS501-ABBS6295) as fully defined in the specification. Detecting VD-associated features and VPI is useful for the serenting of VD, for identifying a subject at risk of VD or for monitoring the effect of therapy administered to a subject having VD. Nucleic acids a constaint of VD, in inhibiting the function of a VPI are useful for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

Preparation for diagnosing or treating bipolar affected disorder (BAD) or unipolar depression, or for screening for modulators, comprises a BAD-associated protein isoform.
                                                                                                                                                                                                                                          New schizophrenia associated protein isoforms and encoding nucleic acid molecules, useful for treatment, diagnosis and prognosis of schizophrenia and screening for potential drugs for treatment and new drug targets.
                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequence represents a schizophrenia-associated protein isoform (SPI). These protein isoforms, e.g. SPI-206, SPI-238 and SPI-240 are detectable in cerebrospinal fluid, serum or plasma and are useful markers of schizophrenia. The sequences can be used for treatment and diagnosis of schizophrenia, screening, prognosis, monitoring the results of therapy, identifying patients most likely to respond to a particular therapy and identification of new targets for drug treatment. SPI DNA is useful as a nucleic acid probe to detect the presence of nucleic acids or SPIs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; Bipolar Affective Disorder; BAD; Depression-Associated feature; DF; Depression-Associated protein isoform; DPI; Cerebro-spinal fluid; CSF; antidepressant; antimanic; nootropic; tranquiliser; neuroleptic; attention deficient disorder; schizoaffective disorder;

The present invention relates to the identification of depression associated protein isoforms (DPIs), particularly the tryptic digest deptides of these proteins. Some of the DPIs (AMU28404-AMU2842) beptides of these proteins. Some of the DPIS (AMU28404-AMU2843) at affective disorder) ambjects, whilst other DPIs (AMU28626-AMU28837) are increased in BAD subjects. Also described are peptide sequences increased in BAD subjects. Also described are peptide sequences can oppressed by The sequences of the invention are useful for clinical screening, diagnosis, prognosis, therapy and prophylaxis of neuropsychatric disorders e.g. BAD (also known as bipolar mood disorder, schizoaffective disorders, attention deficit disorders, schizoaffective disorders, attention deficit disorders. The present sequence represents one of the DPI tryptic digest peptides of the present

Novel nucleic acid encoding a protein associated with bipolar affective disorder, which is used for diagnosis, prophylaxis and therapy of neuropsychiatric disorders, such as bipolar affective disorder.

```
The invention relates to a preparation comprising an isolated Bipolar Associated Protein Isoform (DPIS). The DPI's are used to screen, diagnose or prognose of BAD or unipolar depression, dentify a ceremine the stage or severity of BAD or unipolar depression, dentify a cheer is so is developing BAD or unipolar depression, or monitor the subject at risk of developing BAD or unipolar depression, or monitor the cleentify agents that interact with a DPI. These agents, antibodies daying the DPIS, and mucleic acids encoding the DPIS are used to treat a capinate the DPIS, and mucleic acids encoding the DPIS are used to treat a capinate the DPIS, and mucleic acids encoding the DPIS are used to treat a capinate the disorder. A schizoaffective disorder, a bipolar or a creening approach of using DPIS for screening, diagnosis of BAD or unipolar depression overcomes the problems of using gene expression analysis, such as not being able to obtain central nervous present sequence is a DIP decreased in the CSF (cerebro-spinal fluid) of subjects having BAD
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Diagnosing and monitoring Schizophrenia by detecting the presence of Schizophrenia Associated Features and Schizophrenia Associated Protein Isoforms in samples of cerebrospinal fluid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Schizophrenia; neuroleptic; diagnostic; neuropsychiatric disorder; neurological disorder; neuropathy.

SCH and the relative abundance of at least 1 chosen feature correlates with the presence or absence of SCH; and (2) monitoring the effect of therapy administered to a subject with SCH and the relative abundance of at least 1 chosen feature which correlates with the severity of SCH. The expression and activity of the SFS, SPIs and related molecules (e.g. secondary messengers) are studied to diagnose SCH, monitor the progress of the disorder and the effectiveness of treatment and a targets to identify and produce potential therapeutic agents for the treatment of SCH. The paucity of detectable neuralgic defects distinguishes neuropsychiatric disorders such as SCH from neurological disorders, where manifestations of anatomical and biochemical changes have been identified in many cases. Consequently the identification and characterisation of cellular and/or molecular causative defects and neuropathies are measured to improve treatment of neuropsychiatric disorders. AAUISI14-AAUIS762 represent the amino acid sequences of schizophrenia-associated isoforms used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Screening for Alzheimer's disease in a mammal, by making two-dimensional array of a feature whose relative abundance correlates with disease, and comparing with abundance of the feature in samples of healthy persons.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to methods for the screening, diagnosis and prognosis of Alzheimer's disease. The methods involve the detection of Alzheimer's Disease-Associated Features (AFE) and Alzheimer's Disease-Associated Features (AFE) and Alzheimer's Disease-Associated Protein Isoforms (APIS) in cerebrospinal fluid, serum or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The invention relates to methods for the screening, diagnosis and prognosis of Alzheimer's disease. The methods involve the detection of Alzheimer's Disease-Associated Features (AFS) and Alzheimer's Disease-Associated Features (AFS) and Alzheimer's Disease-Associated Protein Isoforms (AFS and APIS) in cerebrospinal fluid, serum or Expression Reference Protein Isoform (ERPI) in order to determine whether a patient is suffering from, or has a predisposition to, Alzheimer's Disease. The relative abundance of the AFS and APIS correlates with the severity of Alzheimer's Disease. The present sequence is a peptide produced from an API by proteolysis
plasma. The abundance of the AFs and APIs is then normalised to an Expression Reference Protein Isoform (ERPI) in order to determine whether a patient is suffering from, or has a predisposition to, Alzhahmer's Disease. The relative abundance of the AFs and APIs correlates with the severity of Alzhaimer's Disease. The present sequence is a peptide produced from an API by proteolysis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Screening for Alzheimer's disease in a mammal, by making two-dimensional array of a feature whose relative abundance correlates with disease, and comparing with abundance of the feature in samples of healthy persons.
                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; neuroprotective; nootropic; gene therapy; vaccine;

This invention relates to a novel method for screening or diagnosing consisting multiple sclerosis (MS) in a subject to determine the stage or severity conf. MS. to identify a subject at risk of developing MS or to omnitor the effect of a therapy administered. The method comprises analysing a sample confect of a therapy administered. The method comprises analysing a sample conficing the presence of multiple sclerosis-associated features (MSFS), detecting the presence of multiple sclerosis-associated features (MSFS), of the invention correspond to spots identified on a 2D gel these proteins the invention correspond to spots identified on a 2D gel these proteins convention and the compositions are useful for clinical screening.

Confidence may have antiinflammatory or neuroprotective activity. The methods of the invention and treatment of MS, for monitoring the effectiveness of MS treatment. For selecting participants, in clinical trials, for identifying the respond to a particular therapeutic treatment and constitution or delay to expression or activity of an MSPI are useful for treatment and MS, to prevent or delay the progression or activity of an MSPI are useful for preventing or delaying the onset or development of MS, to prevent or delay the progression of MS, or to ameliorate the symptoms MS. Nucleic confidence the fragments are useful for promoting number of therapy. The present sequence represents a human multiple sclerosis therapy. The present sequence represents a human multiple sclerosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Screening or diagnosing multiple sclerosis (MS), useful for e.g. determining the stage or severity of MS, comprises detecting the presence of MS-associated features or protein isoforms by 2-dimensional
                                                                                                                                                                                                                                                         Multiple sclerosis associated feature (MSF) tryptic digest peptide #389.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

This invention relates to a novel method for screening or diagnosing multiple sclerosis (MS) in a subject to determine the stage or severity of MS, to identify a subject at risk of developing MS or to monitor the effect of a therapy administered. The method comprises analysing a sample body fluid from the subject by two-dimensional electrophoresis and detecting the presence of multiple sclerosis-associated features (MSFB), or multiple sclerosis-associated protein isoforms (MSFB). The MSF's of the invention correspond to special identified on a 2D gel these proteins may have antinflammatory or neuroprotective activity. The methods of the invention and the compositions are useful for clinical screening, diagnosis and treatment of MS, for monitoring the effectiveness of MS treatment, for selecting participants in clinical trials, for identifying participants in clinical trials, for identifying teatients most likely to respond to a particular therapeutic treatment and for screening and developing drugs for treatment of MS. Agents that modulate the expression or activity of an MSPI are useful for treating or delaying the onest or development of MS. Nucleic acids comprising a sequence encoding an MSPI, MSPI function by gene therapy. The present sequence represents a human multiple sclerosis associated feature tryptic digest peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Screening or diagnosing multiple sclerosis (MS), useful for e.g. determining the stage or severity of MS, comprises detecting the presence of MS-associated features or protein isoforms by 2-dimensional
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Multiple sclerosis associated feature (MSF) tryptic digest peptide #218.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Multiple sclerosis; MS; multiple sclerosis associated feature; MSAF; human; multiple sclerosis-associated protein isoform; MSPI; antiinflammatory; neuroprotective.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match 72.7%; Score 24; DB 5; Length 7; Best Local Similarity 57.1%; Pred. ```
The present sequence is that of a peptide fragment of a novel human 50.8 kDa prostate cancer-associated protein that has been identified as a high prostate cancer. The novel protein includes a polypeptide that is related to human serum vitamin D binding protein includes a polypeptide that is related to human serum vitamin D binding protein (VDBP, see ABPS8017). The present peptide corresponds to amino acids 146-150 that distinguish VDBP-related broteins of peptides (see ABPS8005-16) that distinguish VDBP-related proteins of proteins, or which may be characterised as binding specifically to an anti-VDBP antibody. VDBP-related proteins are detectable at a higher concentration in serum from a mammal, e.g. a human, with prostate cancer relative to serum from a healthy mammal and can therefore be used as proteate cancer markers. They permit the rapid detection, preferably before metastases occur, of prostate cancer. A target profetae cancer-associated protein may be detected using a labelled antibody capable of binding specifically to the prostate cancer also useful as targets for treating prostate cancer, and as indicators for monitoring the efficiency of prostate cancer, therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Diagnosing or treating prostrate cancer by detecting in a sample isolated from the individual the presence of prostate cancer-associated protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gapa

Screening, diagnosing or determining the stage or severity of breast cancer, composites analyzing and quantitatively detecting Breast Cancer-Associated Peatures or Breast Cancer-Associated Protein Isoforms in a biological sample.

Example, Page 77; 88pp; English.

The present invention describes a method for screening, diagnosing or determining the stage or severity of breast cancer, identifying a subject at risk of developing breast cancer, by generating a two-at risk of developing breast cancer, by generating a two-diministered to a subject with breast cancer, by generating a two-diministered to a subject with breast cancer, by generating a two-diministered to a subject with breast cancer, by generating a two-diministered to a subject with breast cancer, by generating a two-diministered (BPIs). Also described: (1) an antibody capable of immunospecifically binding to one of the BPIs; (2) a pharmaceutical compositions comprising: (4) a BPI, or a nucleic acid encoding a BPI, and a carrier; (3) screening for agents that interact with one compositions comprising: (4) screening for agents that interact with one or more BPIs, BPI fragments, polypeptides related to BPIs, or BPI-fusion proteins; (4) screening for or identifying agents that modulate the composition or activity of one or more BPIs, a BPI related polypeptide, or BPI-fusion proteins; and (5) treating or preventing the present invention can be used for screening, diagnosing or determining the stage or severity of breast cancer. The antibodies, BPIs, and anchoring breast cancer, identifying a subject at risk of developing breast cancer, in monitoring the effect of therapy or monitoring the Energy administered to a subject with breast cancer. The antibodies, BPIs, nucleic acids encoding the BPIs, or an agent that modulates the activity administered to a subject with breast cancer. The antibodies, BPIs, and concerning the BPIs or an agent that modulates the activity of one or more BPIs are useful for treasting or preventing breast cancer. ABPISTION to

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         US-09-423-468A-6

Sequence 6, Application US/09423468A

Sequence 6, Application US/09423468A

Patent No. 6469149

GENERAL INFORMATION:

APPLICANT: Vlaams Interuniversitair Instituut voor Biotechnol

APPLICANT: Guy Jerome Corneel Bauw

APPLICANT: Guy Jerome Corneel Bauw

APPLICANT: Mark William Davey

APPLICANT: Marc Charles Ernest Van Montagu

ITLE OF INVENTION: PRODUCTION OF ASCORBIC ACID IN PLANTS

FILE REFERENCE: DECLES. 001APC

CURRENT APPLICATION NUMBER: US/09/423,468A

CURRENT FILING DATE: 2000-02-15

PRIOR APPLICATION NUMBER: NL 1006000

PRIOR APPLICATION NUMBER: NL 1006000

PRIOR FILING DATE: 1997-06-07

NUMBER OF SEQ ID NOS: 15

SEQ ID NO 6

LENGTHA: 7

LENGTHA: 7

Sequence 4, Application PC/TUS9510793

GENERAL INFORMATION:

APPLICANT: Vakubu-Madus, Patima E.

TITLE OF INVENTION: BIOLOGICALLY ACTIVE FRAGMENTS OF

TITLE OF INVENTION: GIUCAGON-LIKE INSULINOTROPIC PEPTIDE

NUMBER OF SEQUENCES: 13

CORRESPONDENCE ADDRESS:

ADDRESSED: Eli Lilly and Company/RSM

STREET: Lilly Corporate Center

CITY: Indianapolis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PAREAL INFORMATION:

N'-terminal sequence analysis of N alpha-acetylated proteins after
unblocking with N-acylaminoacyl-peptide hydrolase.";
Anal. Blochem. 199:45-50(1991).
-!- FUNCTION: This enzyme catalyses the hydrolysis of the N-terminal
peptide bond of an N-acetylated peptide to generate an N-acetylated amino acid and a peptide with a free N-terminus. It
preferentially cleaves off Ac-Ala, Ac-Met and Ac-Ser.
-!- CATALYTIC ACTIVITY: Acylaminoacyl-peptide + H(2)0 = acylamino acid
                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

Plasmid group cp32-9.
Bacteria, Spirochaetes, Spirochaetales, Spirochaetaceae, Borrelia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Synechococcus sp. (strain PCC 8801 / RF-1) (Cyanothece PCC 8801).
Bacteria; Cyanobacteria; Chrococcales; Cyanothece.
  "A novel active pentapeptide from chicken brain identified by antibodies to FWRRamide";
Nature 305:228-330(1983).
-!- FUNCTION: MAY FUNCTION AS A NEUROTRANSMITTER OR MODULATOR.
-!- STATLARITY: BELONGS TO THE FARP (FMRFAMIDE RELATED PEPTIDE)
GO; GO:0007218; P:neuropeptide signaling pathway; TAS.
Neuropeptide; Amidation.

Claim 8; Page 55; 298pp; English.

The invention relates to a novel antibody comprising a variable heavy (VH) domain, variable light (VL) domain, VH complementarity determining region (CDR)-1, VH CDR2, VH CDR3, VL CDR1, VL CDR2 or VL CDR3, where the antibody immunospecifically binds to a respiratory syncytial virus (RSV) antigen, and where the antibody is not SYNAGIS (RTM). The antibody of the invention has virucide, pulmonary, antiinflammatory, cardiant, anti-HIV, and immunostimulant activity. The polynucleotides of the invention may

Gaps ö

```
have a use in a vaccine, and in gene therapy. The antibody is useful for treating or ameliorating a RSV infection in a human. The antibody is also useful for preventing, treating or ameliorating one or more symptoms associated with RSV infection in a mammal, e.g. cystic fibrosis, bronchopulmonary dysplasia, congenital heart disease, congenital immunodeficiency, or acquired immunodeficiency, or after a bone marrow transplant. The sequence represents a complementary determining region peptide from a human RSV antibody of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Respiratory syncytial virus; RSV; vaccine; antibody; variable heavy domain; VH; variable light domain; VL; complementarity determining region; CDR; CDR1; CDR2; CDR3; RSV infection; cystic fibrosis; bronchopulmonary dysplasia; congenital heart disease; congenital immunodeficiency; acquired immune deficiency;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antibody comprising a variable heavy (VH) or variable light (VL) domain or complementarity determining region (CDR), such as CDR1, CDR2, or CDR3, useful for preventing or treating a respiratory syncytial virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention describes an antibody comprising a variable heavy (VH) or variable light (VL) domain or complementarity determining region (CDR), such as CDR1, CDR2, which immunospecifically binds to a respiratory syncytial virus (RSV) antigen and is not SYNAGIS (RTW). The antibody, pharmaceutical compositions and methods are useful for preventing, treating or ameliorating a RSV infection in patients with cystic fibrosis, bronchopulmonary dysplasia, congenital heart disease, congenital immunodeficiency, or acquired immuno deficiency, or patients having had a bone marrow transplant or the elderly. This is the anino acid sequence of a respiratory syncytial virus (RSV) antibody peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Respiratory syncytial virus (RSV) antibody fragment #126.
                                                                                                                                                                                                                  Score 20; DB 5; Length 7; Pred. No. 1.4e+06; 1; Mismatches 0; Indels

The invention relates to a method of preventing, treating or ameliorating one or more symptoms associated with a respiratory syncytial virus (RSV) infection in a mammal. A sustained release formulation comprising one or more antibodies or their fragments that immunospecifically bind to one or more RSV antigens and a pharmaceutical composition comprising one or more antibodies or their fragments that immunospecifically bind to one or more RSV antigens formulated for pulmonary delivery is useful for preventing, treating or ameliorating one or more symptoms associated with a RSV infection in a mammal by administering the formulation to the mammal, or the composition to the lungs of the mammal. The antibodies bind to RSV antigen with a high affinity and/or high avidity. The methods use lower doses of antibodies which immunospecifically bind to RSV antigen, and which provide a more effective prophylaxis. The present sequence represents the amino acid sequence of a complementarity determining region based on the SYNAGIS antibody.

This sequence represents a fragment of the heavy chain (HAI) of the haemagglutinin of influenza virus. This sequence was used to test the acryloylated peptide polymer of the invention. The peptide polymers are used to raise an immune response to a peptide epitope (such as this sequence), and also as diagnostic tools. Polymers (molecular wt. >600 kDa.) can be prepared with virtually any number of the same or different epitopes by a method that allows purification of the individual determinants, avoids errors inherent in long sequential syntheses in which protected peptide fragments are not used, thus avoiding solubility and purification problems. Multiple copies of many different peptide epitopes may be incorporated into a single polymeric structure to allow utilisation of the range of T cell epitopes required for outbred populations in conjunction with epitopes representing different pathogenic serodemes, thus making them a significant advance in synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Acryloylated peptide polymers - useful for synthetic vaccine technology, for raising an immune response to peptide epitope and as diagnostic tool
                                                                                                                                                   Acryloylated peptide polymer; immune response; peptide epitope; synthetic vaccine; enzymatically cleavable site.

arthritis (RA) using two-dimensional electrophoresis to generate a two-dimensional array of featuree. The method can be used for screening, diagnosis and prognosis of RA in a subject or for monitoring the effect of an anti-RA drug or therapy administered to a subject. The method comprises: (a) analysing a sample of serum or plasma and optionally comprises: (a) analysing a sample of serum or plasma and optionally comprises: (a) analysing a sample of serum or plasma and optionally comprises: (a) analysing a sample of serum or plasma and optionally comprises: (b) identifying at least one chosen feature whose relative abundance correlates with the presence or absence of RA, and (c) comparing the abundance of each chosen feature in the sample with the abundance of that chosen feature or plasma from one or more persons without RA, where the relative abundance of the chosen feature or features in the sample indicates the presence or absence of RA in the subject. The method can also be used in clinical studies for testing drugs for therapy of RA, for purification of RA-diagnostic feature (RADF) proteins can be used to identify compounds that promote or inhibit their activity, which are then used as RA drugs. Nucleic acid encoding RADFs can be used in gene therapy protocols. AAY41131 represent expression reference protein isoform peptides and AAZ25066 to AAZ25068 represent degenerate probes for RPIS, which are all cused in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The invention relates to screening, diagnosis or prognosis of Vascular Dementia (VD) in a subject comprising analysing body fluid from the subject by 2-dimensional (2-D) electrophoresis to generate a 2-D array of features containing at least one chosen feature whose relative abundance correlates with the presence, absence, stage or severity of VD or predicts the onset or course of VD, especially detecting in a sample of cerebrospinal fluid (CSF) from the subject one of 223 VD-associated specification. Detecting VD-associated features and VPI is useful for the screening, diagnosis or progneted features and VPI is useful for the screening, diagnosis or prognessis of VD, for determining the stage or the affect of therapy administered to a subject having VD. Nucleic acids encoding a VPI or inhibiting the function of a VPI are useful for the treatment of VD and for gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Screening, diagnosis or prognosis of vascular dementia (VD), useful for determining stege of VD and monitoring the effect of VD therapy, comprises analyzing body fluid by 2-dimensional electrophoresis for features correlated with VD.
                                                                                                                                                   Vascular Dementia; VD; VD-associated protein isoform; VPI; screening;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Thritis (RA) using two-dimensional electrophoreeis to generate a two-dimensional array of features. The method can be used for screening, diagnosis and prognosis of RA in a subject or for monitoring the effect of an anti-RA drug or therapy administered to a subject. The method compariess: (a) analysing a sample of serum or plasma and optionally compariess: (a) analysing a sample of serum or plasma and optionally dimensional array of features) (b) identifying at least one chosen dimensional array of features of b) identifying at least one chosen feature whose relative abundance correlates with the presence or absence of RA; and (c) comparing the abundance of each chosen feature in serum or plasma from one or more persons without RA, where the relative abundance of the chosen feature or more persons without RA, where the relative abundance of the chosen feature or more persons without RA, where the relative abundance of the chosen feature or features in the sample indicates the presence of absence of RA in the subject. The method can also be used in clinical absence of RA in the subject. The method can also be used in clinical chosen feature in soforms (RPIs), and for production of antibodies to RPIs. The RA-diagnostic feature (RADF) proteins can be used to identify compounds that promote or inhibit their activity, which are then used as RA drugs. Nucleic acid encoding RADFs can be used in gene therapy protections and the expression reference protein isoform peptides and AAZ25066 to AAZ25068 represent edgenerate probes for RPIs, which are all cust and the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ô

```
The invention relates to screening, diagnosis or prognosis of Vascular Dementia (VD) in a subject comprising analysing body fluid from the subject comprising analysing body fluid from the features containing at least one chosen feature whose relative abundance correlates with the presence, absence, stage or severity of VD or predicts the onset or course of VD, especially detecting in a sample of cerebrospinal fluid (CSP) from the subject one of 223 VD-associated protein isoforms (VPIS) (ABB55801-ABB56295) as fully defined in the specification. Detecting VD-associated features and VPI is useful for the screening, diagnosis or prognosis of VD, for determining the stage or severity of VD, for identifying a subject at risk of VD or for monitoring the effect of therapy administered to a subject having VD. Nucleic acids encoding a VPI or inhibiting the function of a VPI are useful for the treatment of VD and for gene therapy
                                                                                                                                                                                                   useful for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to screening, diagnosis or prognosis of Vascular Dementia (VD) in a subject comprising analysing body fluid from the subject by 2-dimensional (2-D) electrophoresis to generate a 2-D array of features containing at least one chosen feature whose relative abundance correlates with the presence, absence, stage or severity of VD or predicts the onset or course of VD, especially detecting in a sample of cerebrospinal fluid (CSF) from the subject one of 223 VD-associated specification. Detecting VD-associated features and VPI is useful for the screening, diagnosis or prognosis of VD, for determining the stage or severity of VD. for identifying a subject at risk of VD or for monitoring the effect of therapy administered to a subject having VD. Nucleic acids encoding a VPI or inhibiting the function of a VPI are useful for the treatment of VD and for gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                         Screening, diagnosis or prognosis of vascular dementia (VD), useful for determining stage of VD and monitoring the effect of VD therapy, comprises analyzing body fluid by 2-dimensional electrophoresis for features correlated with VD.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Dementia; VD; VD-associated protein isoform; VPI; screening;

                                                                                                                                                                                                                                                                              ઠે
                                                                                                  The present invention relates to the identification of depression associated protein isoforms (DPIs), particularly the tryptic digest peptides of these proteins. Some of the DPIs (AMU28404-AMU28625) described are decreased in the carebrospinal fluid (CSF) of BAD (bipolar affective disorder) subjects, whilst other DPIS (AAU28626-AAU28887) are increased in BAD subjects, Also described are peptide sequences identified from DPI-45 and DPI-31 and the nucleic acid sequence they are encoded by. The sequences of the invention are useful for clinical neuropsychiatric disorders e.g. BAD (also known as bipolar mood disorder, BP), maniac-depressive illnesses, attention deficit disorders, achizoaffective disorders, and unipolar affective disorders. The present increase represents one of the DPI tryptic disest peptides of the present
                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New schizophrenta associated protein isoforms and encoding nucleic acid molecules, useful for treatment, diagnosis and prognosis of schizophrenia and screening for potential drugs for treatment and new drug targets.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Schizophrenia-associated protein isoform, SPI, SPI-206; SPI-238; SPI-240; neuroleptic; gene therapy; cerebrospinal fluid; serum; plasma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The sequence represents a schizophrenia-associated protein isoform (SPI). These protein isoforms, e.g. SPI-206, SPI-238 and SPI-240 are detectable in cerebrospinal fluid, serum or plasma and are useful markers of
                        Novel nucleic acid encoding a protein associated with bipolar affective disorder, which is used for diagnosis, prophylaxis and therapy of neuropsychiatric disorders, such as bipolar affective disorder.
                                                                                                                                                                                                                                                                                                                                                               Gape
                                                                                                                                                                                                                                                                                                                                                              6

The invention relates to a preparation comprising an isolated Bipolar Affected Disorder (BAD)-Associated Protein Isoform (DPIs). The DPI's are used to screen, diagnose or prognose of BAD or unipolar depression, dentify a cubject at risk of developing BAD or unipolar depression, identify a cubject at risk of developing BAD or unipolar depression, identify a cubject at risk of developing BAD or unipolar depression, or monitor the effect of therapy in a subject. They are also used to screen for or identify agents that interact with a DPI. These agents, antibodies against the DPIs, and nucleic acids encoding the DPIs are used to treat or prevent BAD or unipolar depression. Diseases that can be treated are unipolar affective disorder, a schizoaffective disorder, a bipolar or proteomic approach of using DPIs for screening, diagnosis or prognosis of unipolar depression overcomes the problems of using gene control of using DPIs for screening, diagnosis or prognosis of EAD or unipolar depression overcomes the problems of using gene companysis, such as not being able to obtain central nervous system (CMS) tissue from a living patient under normal circumstances. The present sequence is a DIP decreased in the CSF (cerebro-spinal fluid) of
                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
schizophrenia, screening, prognosis, monitoring the results of therapy, identifying patients most likely to respond to a particular therapy and identification of new targets for drug treatment. SPI DNA is useful as another acid probe to detect the presence of nucleic acids or SPIs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               (BAD)

The invention relates to methods for the screening, diagnosis and prognosis of Alzheimer's disease. The methods involve the detection of Alzheimer's Disease-Associated Peatures (AFS) and Alzheimer's Disease-Associated Peatures (AFS) and Alzheimer's Disease-Associated Protein Isoforms (APIS) in cerebrospinal fluid, serum or Baptsma. The abundance of the AFS and APIS is then normalised to an Baptsmession Reference Protein Isoform (BRRI) in order to determine whether a patient is suffering from, or has a predisposition to, Alzheimer's Beaverity of Alzheimer's Disease. The relative abundance of the AFS and APIS correlates with the produced from an API by proteolysis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Screening for Alzheimer's disease in a mammal, by making two-dimensional array of a feature whose relative abundance correlates with disease, and comparing with abundance of the feature in samples of healthy persons.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, neuroprotective, nootropic, gene therapy; vaccine,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to methods and compositions for screening, diagnosis and prognosis of Schizophrenia. The method involves detecting the presence of Schizophrenia (SCH) Associated Features (SPS) and SCH. Associated Protein Isoforms (SPIs) in samples, e.g. by electrophoresis, immunoassay or hybridisation assay, for diagnosing and monitoring SCH, studying the effectiveness of treatments and for identifying potential therapeutic agents. The method is used for (1) screening or diagnosis of SCH and the relative abundance of at least 1 chosen feature correlates with the presence or absence of SCH; and (2) monitoring the effect of the herapy administered to a subject with SCH and the relative abundance of at least 1 chosen feature which correlates with the severity of SCH. The secondary messengers) are studied to diagnose SCH, monitor the progress of the disorder and the effectivenes of treatment and as targets to identify and produce potential therapeutic agents for the treatment of SCH. The paucity of detectable neuralgic defects distinguishes neuropsychiatric disorders such as SCH from neurological disorders, where manifestations of antomical and biochemical changes have been identified in many cases. Consequently the identification and characterisation of cellular and/or molecular causative defects and neuropathies are necessary for improved treatment of neuropsychiatric disorders. Abuls114-ANUS762 represent the amino acid sequences of schizophrenia-associated isoforms used in the method of the invention

The invention relates to a novel antibody comprising a variable heavy

(WH) domain, variable light (WL) domain, WH complementarity determining
region (CDR1, "WH CDR2, "WH CDR1, "WL CDR2, "WL CDR3, where the
antibody immunospecifically binds to a respiratory syncytial virus (RSV)
antigen, and where the antibody is not SYNAGIS (RTM). The antibody of the
invention has varicale, pullmonary, antihifflammatory, cardiant, anti-HIV,
and immunostimulant activity. The polymuleotides of the invention may
have a use in a vaccine, and in gene therapy. The antibody is useful for
treating or ameliorating a RSV infection in a human. The antibody is also
useful for preventing, treating or ameliorating one or more symptoms
associated with RSV infection in a mammal, e.g. cystic fibrosis,
conchopulmonary dysplasia, congenital heart disease, congenital
immunodeficiency or acquired immunodeficiency, or after a bone marrow
transplant. The sequence represents a complementary determining region
peptide from a human RSV antibody of the invention
                                                                                                                                                                                               Human, variable heavy domain, variable light domain, CDR, VH, VL, RSV, complementarity determining region, respiratory syncytial virus; virucide, pulmonary, antiinflammatory, cardiant, anti-HIV; vaccine; immunostimulant, gene therapy, cystic fibrosis; bone marrow transplant, bronchopulmonary dysplasia; congenital heart disease; congenital immunodeficiency; acquired immunodeficiency.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antibody for treating respiratory syncytial virus (RSV) infection, comprises a variable heavy/light domain or complementarity determining regions 1 - 3 of variable light/heavy chains, that immunospecifically binds to RSV antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             61.3%; Score 19; DB 5; Length 7; 80.0%; Pred. Sequence 164, Application US/0996288

Patent No. US20020177126A1

Patent No. US20020177126A1

APPLICANT: Young, James

APPLICANT: Scott, Koenig

APPLICANT: Leslie, Johnson

TITLE OF INVENTION: Methods of Adminstering/Dosing Anti-RSV Antibodies for Prophyl

TITLE OF INVENTION: and Treatment

FILE REPERROE: 10271-047-999

CURRENT APPLICATION NUMBER: US/09/996,288

CURRENT PILING DATE: 2001-11-28

NUMBER OF SEQ ID NOS: 259

SOFTWARE: PatentIn version 3.1

Sequence 24, Application US/09897107

Patent No. US20020137094A1

GENERAL INFORMATION:
TYPLE OF INVENTION: METHOD FOR IMPROVING THERMOSTABILITY OF PROTEINS, PROTEINS HAVING TITLE OF INVENTION: THERMOSTABILITY INPROVED BY THE METHOD AND NUCLEIC ACIDS ENCODIN FILE REPRENCE: 2101-07-03

CURRENT APPLICATION NUMBER: UP2000-201920

PRIOR PILING DATE: 2001-07-03

PRIOR PILING DATE: 2001-07-04

PRIOR PILING DATE: 2001-05-31

PRIOR PILING DATE: 2001-05-31

NUMBER OF SEQ ID NOS: 104

SEQ ID NOS: 104
